1. How does the bootstrap grid system work?

The grid system in Bootstrap is a responsive layout format that facilitates the creation of responsive and mobile-friendly web designs by organizing content into a grid with rows and columns. The grid system is based on a 12 column layout that provides flexibility in organizing content across various screen sizes, i.e. mobile devices, tablets, computers etc. By utilizing containers, rows, columns, breakpoints, offsets, and nesting you can create responsive webpages and layouts that are not only user friendly but visually appealing and efficient.

2. Highlight of what I've learned this week.

This week had a lot in store for us, WOW! Bootstrap is like having a power drill with 10,000 bit attachments, in that, it's somewhat easy to get a grasp of but the sheer amount of things that can be done with it is astonishing. My highlight of the week was collaborating with classmates and seeing their projects come to life. It's beginning to dawn on me, as we near closer and closer to the second half of this program, that the importance of teamwork and positive support is paramount in the development industry. It does feel good to grasp a concept, learn a new skill, solve a hard problem on your own. However, I have found more joy in the team work and collaborative efforts with fellow newbie developers! Another very exciting part of this week was seeing my website come to life with the use of bootstrap and all of its unique components.
